

# KLINGER SAVER

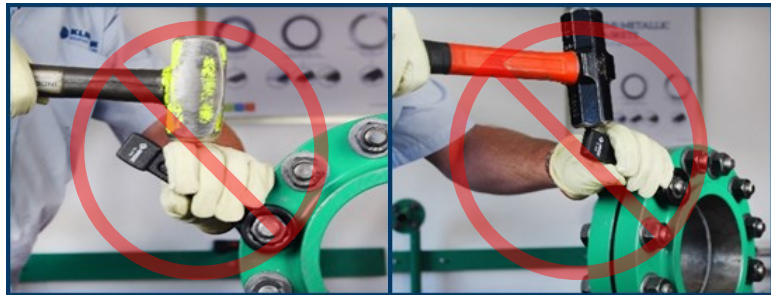

## Hand Safety Tool

KLINGER SAVER guards eliminate hand and finger injuries during bolt tightening/untightening and joint assembly activities. This tool secures and keeps work tools like wrenches in place and keeps fingers and hands safe and away from danger. Workers can better position and extend their reach from a safe distance.

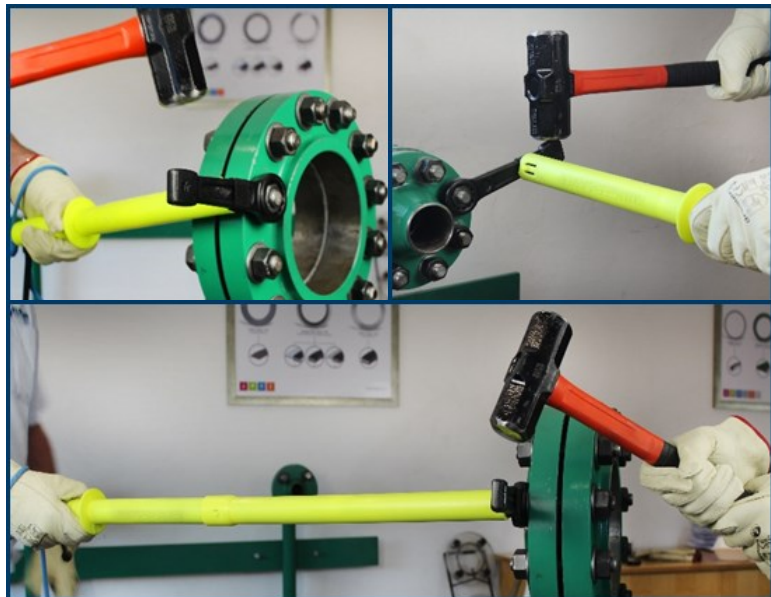

This safety tool is a necessity for maintenance and mechanics in industries where piping and bolted joints are present.

using the  
KLINGER SAVER

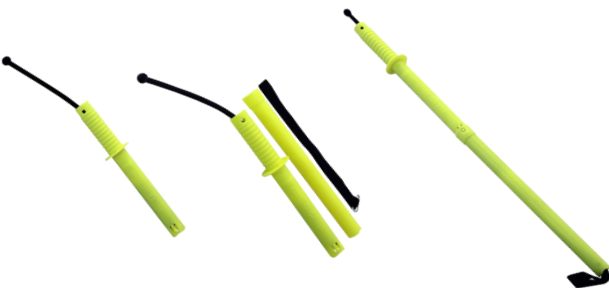

## KLINGER SAVER

### Applications

Bolt tightening or loosening activities and using slug wrenches and hammers are often the cause of serious finger and hand injuries.

The KLINGER SAVER is a safety device that allows assembly technicians to remove their hands from the potential danger of being struck by the hammer.

Wrenches are held securely in place on the nut with webbing attached to a strong rubber cord that is tensioned and locked within a plastic distance tube.

### Properties

The KLINGER SAVER kit includes an extension tube that allows further separation from the strike zone. This is particularly useful when helpers are involved or for hard to reach bolts.

### Materials

The distance and extension pieces are molded from high impact resistance polypropylene.

The cord is molded nitrile rubber with a 60 shore hardness.
